

Additional comments: (1) assume that one employee can only work for one store at the same time (2) Different stores can have items with the same name (3) All items in a given order come from the same store (4) I created super class Employee for DronePilot to allow flexibility, but these two can be put together since DronePilot is the only type of employee in this example (5) word "extends" in the extend/inheritance relationship is embedded in the arrow in Drawio and I am not able to remove it from the diagram. (6) For new order, the system first create a placeholder calling the makeOrder function and then add the content as the first line by calling addLine2Order function
